

DARK ENERGY
SURVEY

A typical day of DES Operations

Andrés Alejandro Plazas Malagón

Department of Physics
Cosmology Group

Group meeting, January 20th/2015

DARK ENERGY
SURVEY

Outline

- The **Dark Energy Survey**: overview
- The **Dark Energy Camera** at the Blanco Telescope
 - Few examples of early results
- **Observer Roles**: Observer 1, Observer 2, Run Manager, Telescope Operators
- **A typical day (and night) at DES in Cerro Tololo**

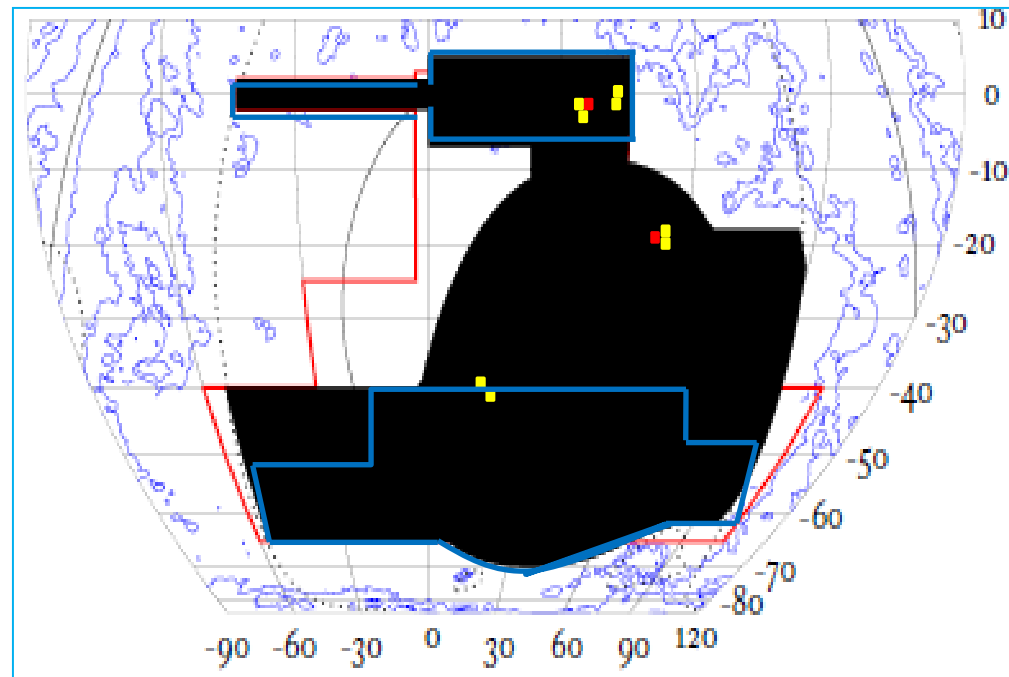

The Dark Energy Survey

DARK ENERGY SURVEY

- 4 complementary techniques to measure acceleration of the Universe
 - Cluster Counts
 - Weak Lensing
 - Large-scale Structure (BAO)
 - Supernovae
- Two multiband imaging surveys:
 - 5000 deg² *grizY* to 24th mag
 - 30 deg² repeat *griz* (SNe)

- Built **DECam**, a 3 deg² FOV camera for the Blanco 4m telescope at CTIO

Survey 2013-2018 (525 nights)
Facility instrument for astronomy community

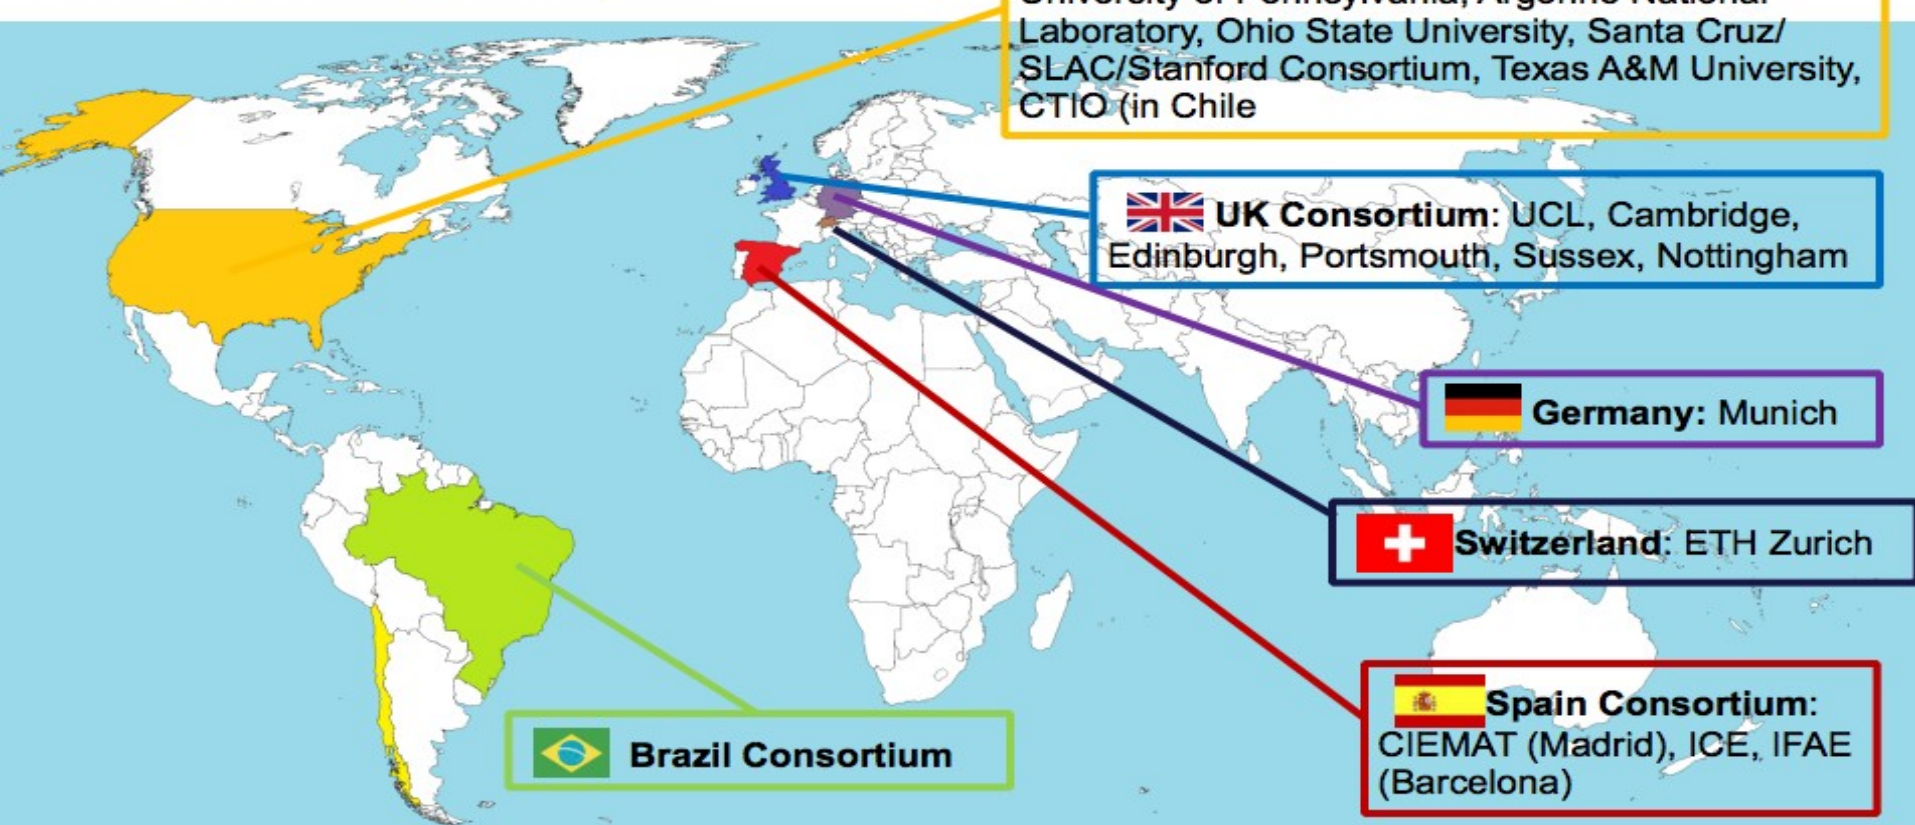

The DES Collaboration

DARK ENERGY
SURVEY

~ 300 scientists

Second Season (Y2)

2015-2018

Third-Fifth Seasons

The V. Blanco telescope on Cerro Tololo, Chile

DARK ENERGY
SURVEY

- **Cerro Tololo** is located about 500km north of Santiago, **Chile**, about 52km east (80km by road) of **La Serena**, at an altitude of 2200 meters.
- It lies on a 34,491Ha (85,227 ac.) site purchased by **AURA** on the open market in 1967 for use as an astronomical observatory.

Cerro Tololo means "at the edge of the abyss" in the Aymara indian language.

Cerro Tololo

DARK ENERGY
SURVEY

Cerro Tololo

DARK ENERGY
SURVEY

The Dark Energy Camera at the Victor Blanco Telescope

DARK ENERGY
SURVEY

- Commissioned in 1974
- Named after Víctor Manuel Blanco (Puerto Rico)
- Ritchie-Chétien telescope (a type of Cassegrain)

- Primary mirror: ~4m
- DECam is on the prime focus

The Dark Energy Camera

DARK ENERGY
SURVEY

DECam: 500 megapixel

Mounted on Blanco 4-m Telescope

DARK ENERGY
SURVEY

Inside the dome

WL: mass of 4 clusters (Melchior et al.,) 1405.4285

DARK ENERGY
SURVEY

Multi-color image of the
inner 5 arcmin

Map of WL aperture mass
significance overlaid with gals
inner 30 arcmin

- Measure the masses and redshifts of four known massive galaxy clusters
- Background galaxies identified using photo-z
- Cluster member galaxies identified using photo-z and RedMaPPer
- Weak lensing analysis using im3shape code

Results in very good agreement with previously known measurements

Table 4. Weak lensing masses M_{200c} in units of $10^{14}M_{\odot}$ (with a flat prior on c_{200c}), redMaPPer richness λ and redshift estimate z_{λ} , and their statistical errors (see Section 3.2 and Section 5.1 for details). The literature mass estimates are derived from weak lensing, galaxy dynamics (D) or optical richness (R).

Cluster name	M_{200c}	λ	z_{λ}	Literature value M_{200c}
RXC J2248.7-4431	$17.6^{+4.5}_{-4.0}$	203 ± 5	0.346 ± 0.004	$22.8^{+6.6}_{-4.7}$ (Gruen et al. 2013b), 20.3 ± 6.7 (Umetsu et al. 2014), 16.6 ± 1.7 (Merten et al. 2014)
1E 0657-56	$14.2^{+10.0}_{-6.1}$	277 ± 6	0.304 ± 0.004	17.5 (Clowe et al. 2004) ⁱ , 12.4 (Barrena et al. 2002, D)
SCSO J233227-535827	$10.0^{+3.7}_{-3.4}$	77 ± 4	0.391 ± 0.008	$11.2^{+3.0}_{-2.7}$ (Gruen et al. 2013a), $4.9 \pm 3.3 \pm 1.4$ (High et al. 2010, R)
Abell 3261	$8.6^{+8.6}_{-3.9}$	71 ± 3	0.216 ± 0.003	—

ⁱ We converted the measured r_{200c} from Clowe et al. (2004), which lacks an error estimate, to M_{200c} using the critical density in our adopted cosmology.

DES can measure galaxy shapes, even in the SV preliminary data set

Photometric analyses (Sánchez et al., 2014)

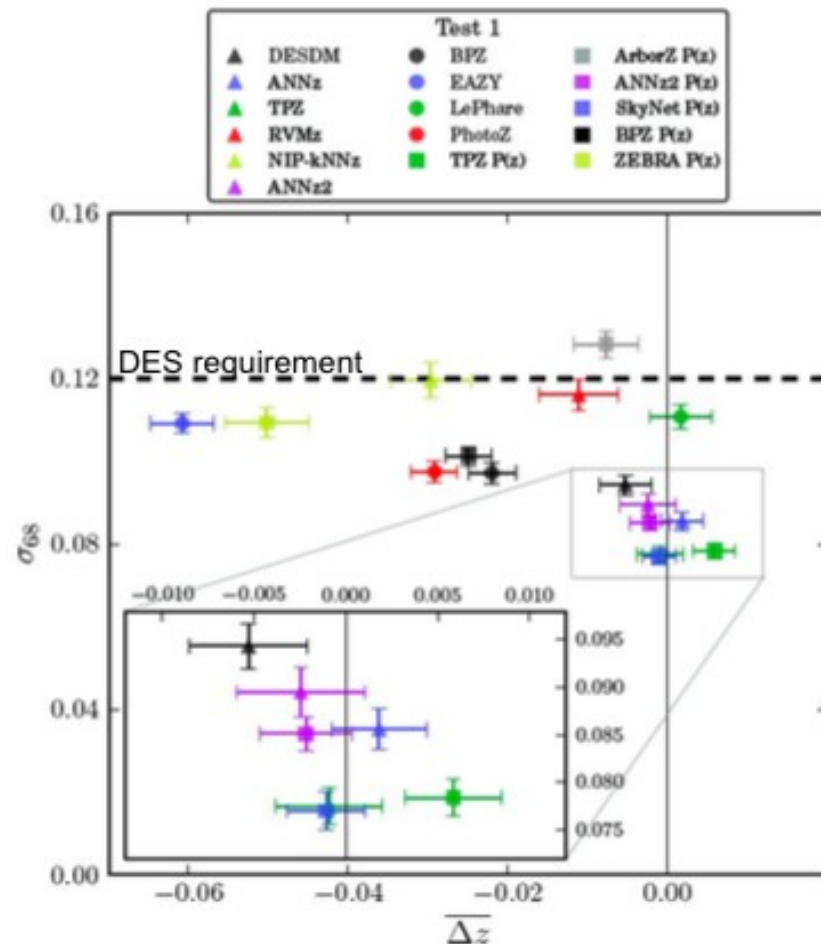

1406.4407

DARK ENERGY
SURVEY

Use 15000 galaxies with spectroscopic determination of the redshift (from several previous surveys) for testing and calibrating photoz

Most of the codes meet the DES science requirements, already at this early stage

This paper proves that DES can measure photometric redshifts

Cross-correlation lensing

DARK ENERGY
SURVEY

Preliminary result using **early DES data**!

DES Observers & Roles

DARK ENERGY
SURVEY

- Observations are staffed by DES Collaborators as a **service contribution**. We typically have 2 (half-night) to 3 (full-nights) shifters.
- Observing Teams include a mix of experience
- Observer stay from 4 to about 21 nights.

DES Observers & Roles

DARK ENERGY
SURVEY

Team

DES has three people at CTIO during survey operations. Two observers (1 and 2) and a Run Manager.

In addition, CTIO staff and [telescope operators \(Telops\)](#) always support operations.

Telops:

The CTIO staff and telops have [intimate knowledge of the Blanco telescope](#) and CTIO facilities. They are also very well [trained in DECam operations](#). They keep the camera and telescope [safe](#). The same telop typically stays on mountain for around one week.

DES Observers & Roles

DARK ENERGY
SURVEY

Observer 1:

Observer 1 “drives” the survey using the [SISPI](#) web interface. They ensure [smooth survey data collection](#). Observers typically stay around one week.

Observer 2:

Observer 2 monitors [data quality](#), [weather](#) conditions, manages the electronic [log book](#) and files [nightly reports](#). Observers typically stay around one week.

Run Manager:

The DES run manager handles [daytime DES operations](#), reviews [night reports](#), plans [observing](#) and [connects the DES collaboration](#), [DES observers](#) and [CTIO staff](#). They cover observing duties as needed and train new observers. They [transfer knowledge](#) to replacement run managers and typically stay on a mountain for [three to four weeks](#)

DECAM Operations: SISPI

DARK ENERGY
SURVEY

- DECAM is controlled through the [Survey Image System Process Integration Software: SISPI](#) “The Readout and control system of the DECAM” Honscheid et al., SPIE 2012
- Observer sends a request to the [Observation Control System \(OCS\)](#)
- Exposure parameters can be entered: **1)** by hand, **2)** through a script, or **3)** by an automated process that knows the survey history, the current time, and the current observing conditions (e.g, [ObsTac](#))
- OCS then queries the [state of the instrument](#), and then send commands to [slew](#) the telescope, to the [hexapod controller](#), and to the [filter changer](#) mechanism.
- After this, the OCS [opens the shutter](#), the [electronics](#) are triggered to readout the [CCDs](#), and then the [image is built](#).
- The [data are recorded](#), and handed over the [NOAO data transfer system](#).

-520 Mpix and 16 bits/pix: ~1GByte per exposure

-250 kpix/s: ~17 seconds to transfer data from focal plane to Image Acquisition System

DECAM Operations: SISPI

DES Operations OBSTAC

DARK ENERGY
SURVEY

- **Observer 1** enables a computer application called **OBSTAC** that chooses the observations a few minutes in advance, based on priority & current conditions

- If the weather is ideal, SN are observed under “deadman” with 6-night gaps
- If poor weather, g-, and Y-band filters (least important for weak lensing)

A typical day of DES operations

(poster at SPIE14 by K. Reil)

DARK ENERGY
SURVEY

~ 8:00: Breakfast

DES staff rarely attend. CTIO staff however start any needed day work on the telescope, dome, camera, etc.

~ 12:00: Lunch

Run manager day starts. Prior night reports are reviewed including **CTIO report** and **DES night summary**. Check in with subsystem managers to address problems from prior night. Need for **4pm operations phone** conference determined.

Run manager meets with **CTIO staff** to discuss operations issues and get report of day work activities, plan out survey. Night ephemeris, standard star fields selected.

CTIO staff attempt to finish all work prior to 4pm teleconference.

A typical day of DES operations

DARK ENERGY
SURVEY

~ 16:00: Daily collaboration wide teleconference.

Review **telescope and camera status**.
Confirm **survey plan**. Determine any non-survey exposures that may be needed.
Telops report on telescope status. **Daily dome flat calibrations run**.

~ 18:30 Dinner.

Start of day for **observers 1 & 2**. DES personnel and CTIO staff together. Evening plan discussion occurs. CTIO will meet any dietary needs/restrictions (including annoying vegan diets like mine ;))

A typical day of DES operations

DARK ENERGY
SURVEY

~ 1h before sunset

One hour prior to sunset **open telescope dome** to aid **temperature equilibrium**.

~ 30m after sunset

Prepare for observations: sensor voltage on, flush sensors, check **Rasicam (cloud monitor)** is working, start quick reduce (real-time data monitoring), load standard star scripts.

Check dome flats from afternoon calibrations.

<https://www.youtube.com/watch?v=i1YsXlsj5CE>

A typical day of DES operations

DARK ENERGY
SURVEY

~48m after sunset

Observations start. Sun at -10 degrees.

Take **pointing exposure** (telescope zero point).

Take **3 sets of standard star exposures**.

~56m after sunset

Survey operations begin. Sun at **-14 degrees**.

Observer Tactician (ObsTac) program keeps the exposure queue filled. Switches between **supernova fields** and **DES survey fields** automatically.

A typical day of DES operations

DARK ENERGY
SURVEY

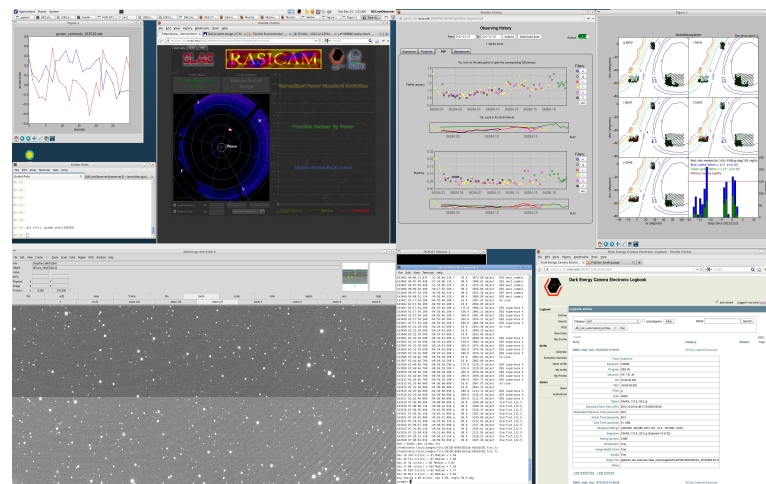

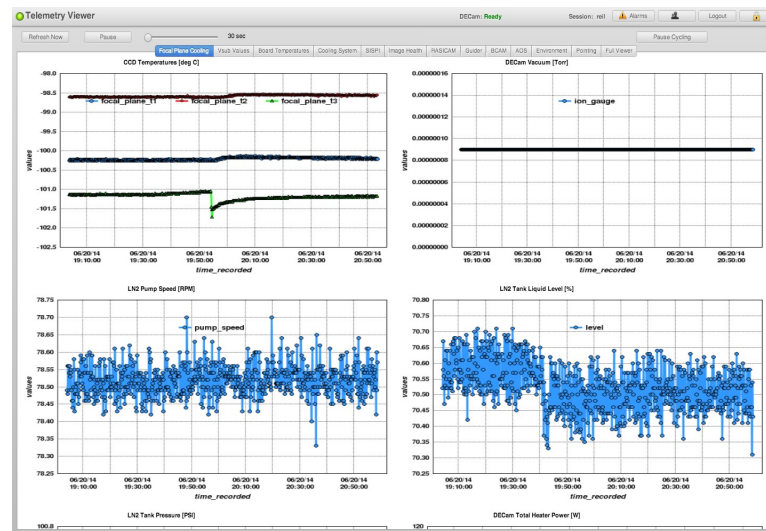

~1h after sunset

All data taking now fully automated

Observer 1 now monitors **telemetry**, **SISPI** performance and data transfers.

Observer 2 monitors **data quality** using **SISPI** (fast data quality), “**quick reduce**” (more detailed data quality), **weather** (rasicam, satellite, outside)

The **run manager** ensures that operations are running **smoothly**. Also provides any **required training for new observers**.

A typical day of DES operations

DARK ENERGY
SURVEY

~1 a.m.

Run manager departs. Observers stay until sunrise.

~1h before sunrise

Around 1 hour prior to sunrise (sun at -14 degrees) **automated observation ends.**

3 sets of **standard star exposures** are taken.

Night summary (nightsum) log and CTIO telescope log submitted.

Dome closed. Camera and telescope secured.

Morning calibrations if no calibrations prior evening.

Bed around sunrise!

A typical day of DES operations

DARK ENERGY
SURVEY

At the end of every DES night a **night summary report** is generated.

<http://decam03.fnal.gov:8080/nightsum/>

Night Summary for MJD 56695 (starting evening of 2014-02-06)

Table of contents

Synopsis .xml

kent (02/07/2014 01:52:36)

Observing Team

DES Observers: Steve Kent, Alex Drlica-Wagner

Telops: Humberto Orrego, Hernan Tirado

Remote Support: Klaus Honscheid

Observing Plan

Half-night plan

1. standard bias and dome flat sequence
2. PTC sequence
3. evening standard stars
4. Try to get SN-X3z to load in obstac
5. Nightly defocus
6. run ObsTac queue
7. middle of the night standard star
8. handover to community observers

Thanks!

http://www.slac.stanford.edu/~lise/mw2_720.mp4

DARK ENERGY
SURVEY

DARK ENERGY
SURVEY

Extra slides

A day (and night) in life

- Observer 1 - wakes for dinner (maybe earlier), goes to control room, makes sure observer 1 evening checklist ready, drives sispi, night lunch, night reports, nightsum, sunrise, bed
- Observer 2 - wakes for dinner (maybe earlier), goes to control room, makes sure observer 2 evening checklist ready, data quality monitoring, night lunch, sunrise, bed

- Run manager - wakes for breakfast, reviews prior nights reports, decides on need for daily meeting, lunch, heads to control room to prepare for evening, gets information from CTIO staff on day work, leads daily phonecan as needed, ensures evening calibrations are run, dinner, control room with observers, make sure everyone knows plan for evening and any updates from phonecon. Start observing, go to bead
- Telops - make magic happen,etc list of all runners and telops.

DES first light (September 2012)

DARK ENERGY
SURVEY

DECam detectors: CCDs

DARK ENERGY
SURVEY

- Thick (300 microns), back illuminated, fully-depleted CCDs with high efficiency in the red.

Credit: Holland et al., 2003

However, **thick CCDs** also leave undesired signatures in **photometry** and **astrometry**

DARK ENERGY
SURVEY

Conclusion

- **Weak Lensing** is a **powerful tool** to learn about **cosmic acceleration**
- To realize its full potential, a large list of **systematic errors** must be overcome e.g, shape and PSF measurements, instrumental signatures.
 - Custom tests of DES show that **shapelets** are **not optimal for shape measurement** due to **noise bias**.
 - **Atmospheric dispersion** can be corrected with color corrections
 - Biases due to **tree rings** in DES CCDs can be corrected with photometric and astrometric templates
- **DES** will be one of the **best data sets** available for **VL**
 - First measurements of cross-correlation lensing are promising
- Lessons from shape measurements in DES will be important for future surveys such as **LSST**, **WFIRST-AFTA**, and **EUCLID**.

DARK ENERGY

Focal Plane Characteristics

DARK ENERGY
SURVEY

Main Characteristics of Focal Plane

Field of View	3 square degree (2.2 degree field of view)
Pixel scale	0.2637 arcsec/pixel (center), 0.2626 arcsec/pixel (edge)
Detector	62, 2048x4096 pixel red-sensitive science CCDs from LBNL, 520 megapixels total (570 Mpix including guide and focus CCDs)
Read-out noise	7e-
Read-out time	20 seconds
Dark-current	$\sim < 25$ e-/pixel/hr (spec)
QE	60% at 0.4 μ , 90% at 0.9 μ
Dynamical range	16 bit
Inter-CCD Gaps	3.0 mm (201 pixels) along long edge (e.g., between S4 and N4); 2.3 mm (153 pixels) along short edge (e.g., between N4 and N5)
Cosmetics	Good to excellent. On average, each CCD has 0.05% bad pixels and the worst CCD has 0.39% bad pixels.
Filters	6 filters now available (ugrizY)
Gain	4.5 e-/ADU (typical, provisional 2012-Nov)
Non linearity, < 1% (provisional/conservative)	For normal observing, keep level below 100,000 e-, 22,000 ADU
Raw data format	FITS (with extensions), 1 GB/file, ~ 600 Mbyte/file compressed
Instrument F ratio	f/2.7
Available filters	<i>u g r i z Y V R</i>

DECam detectors: DALSA/LBNL CCDs

DARK ENERGY
SURVEY

Credit: Holland et al., 2003

However, **thick CCDs** also leave undesired signatures in **photometry** and **astrometry**

DARK ENERGY
SURVEY

The problem of accelerated expansion (“dark energy”)

We observe an **accelerated expansion** of the Universe. Why?

- A cosmological constant?
- A new dynamical field (e.g., quintessence)?
- Modifications to our theory of gravity?

We can know more about this by studying:

- The **history** of the **expansion rate** of the Universe: cluster counting, SNe, WL, BAO
- The **history** of the **growth rate of the LSS**: WL, cluster counting

Large surveys are needed:

- Spectroscopic
- Photometric: photo-z's → **The Dark Energy Survey**
